

### LSR7 At-Home Screening Procedure

The screening of students and staff must begin at home. Parents should evaluate their child before school daily by taking their temperature, gauging how they are feeling, and by making sure that they can accurately answer no to all questions below.

- Is your current temperature in excess of 100.4 degrees Fahrenheit?
- Have you had one high-risk symptom or two moderate-risk symptoms indicating COVID-19 in the last 14 days?
  - High-risk symptoms (1): cough, shortness of breath, difficulty breathing, new loss of taste and smell
  - Moderate-risk symptoms (2): fever (measured or subjective), chills, rigors, muscle aches, headache, sore throat, nausea/vomiting, diarrhea, fatigue, congestion or runny nose
- Have you had a direct exposure to a positive COVID case in the last 14 days?

If a question can be answered yes, then the child should not be sent to school. Families should then seek the guidance of a medical professional or Health Department for further direction. No universal screening will occur at school. However, teachers will have access to thermometers and check students if they are presenting as ill prior to sending to the health room. If a student's temperature check reads equal to or in excess of 100.4 degrees Fahrenheit, the student will be accompanied by a nurse to a precaution room to await parent pick-up. School nurses will discuss return-to-school criteria with parents. All staff will be required to perform similar at-home screenings prior to reporting to work.
